

Network Management

SNMP

Simple Network Management Protocol SNMP

- The Simple Network Management Protocol (SNMP) is a framework for managing devices in an internet using the TCP/IP protocol suite. It provides a set of fundamental operations for monitoring and maintaining an internet.

Concept

Management Components

Structure of Management Information (SMI)

Management Information Base (MIB)

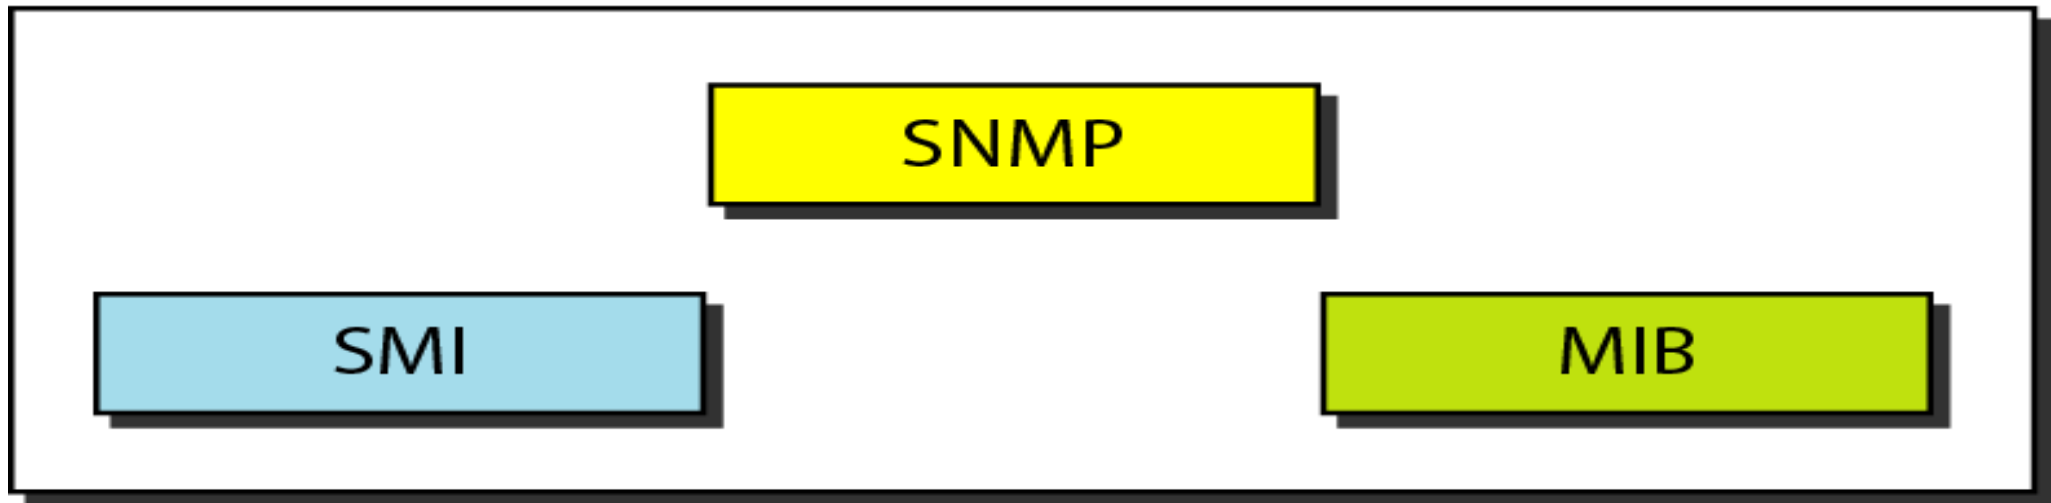

SNMP

SNMP Concept

Components of network management on the Internet

Management

Note

SNMP defines the format of packets exchanged between a manager and an agent. It reads and changes the status (values) of objects (variables) in SNMP packets.

SMI defines the general rules for naming objects, defining object types (including range and length), and showing how to encode objects and values. SMI does not define the number of objects an entity should manage or name the objects to be managed or define the association between the objects and their values.

MIB creates a collection of named objects, their types, and their relationships to each other in an entity to be managed.

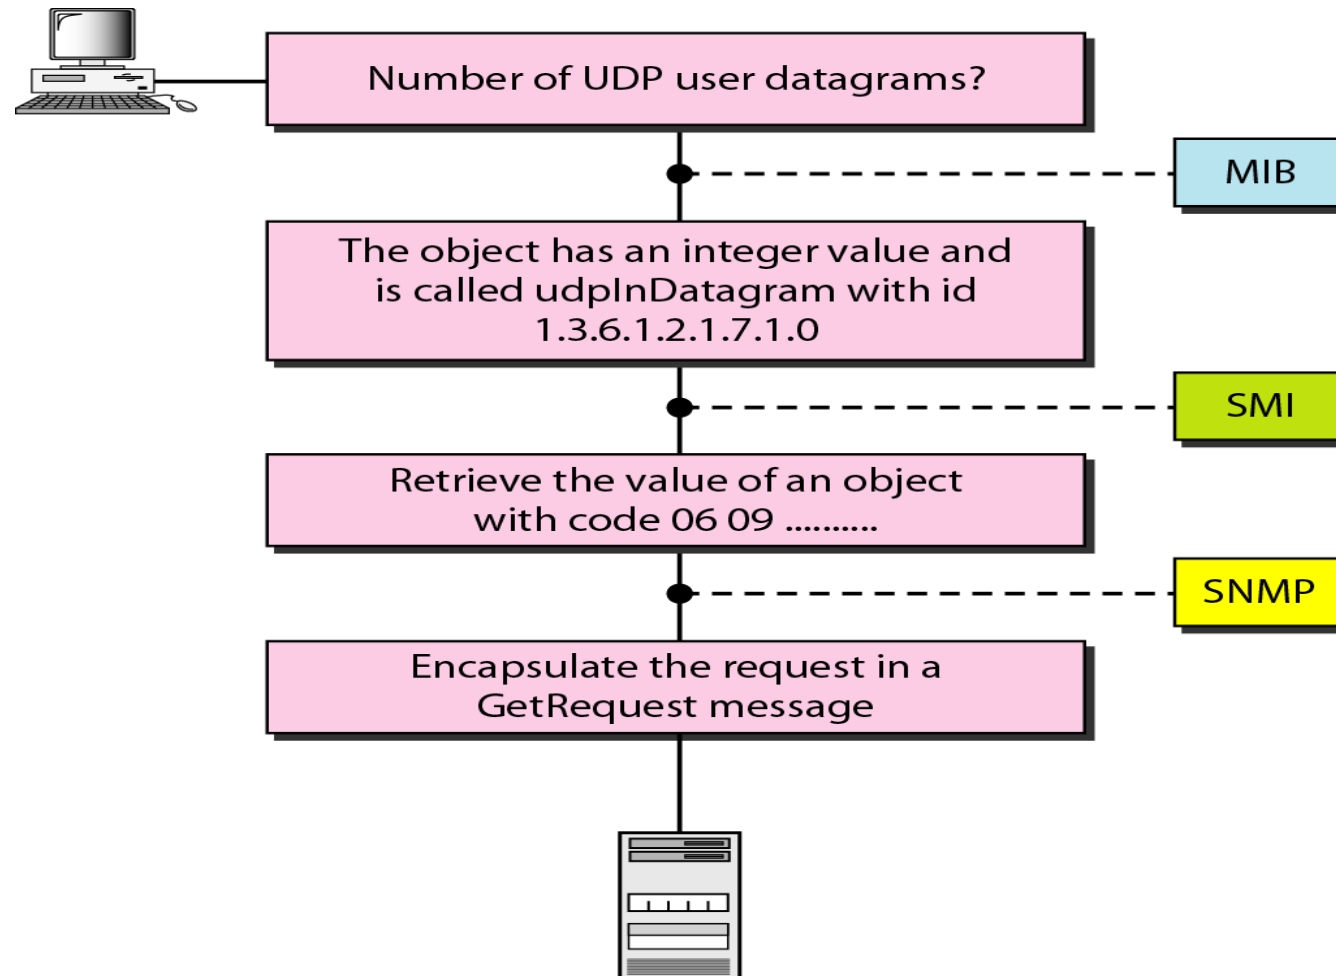

Note

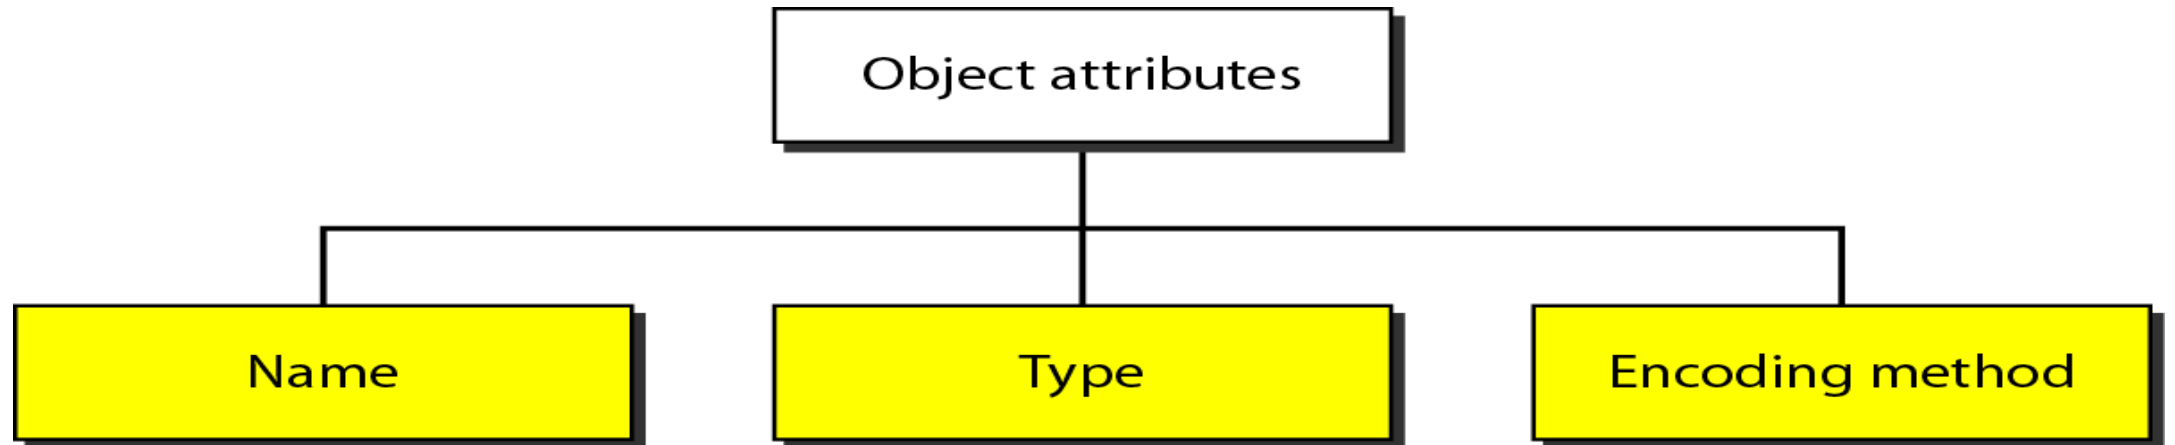

We can compare the task of network management to the task of writing a program.

- ❑ Both tasks need rules. In network management this is handled by SMI.
- ❑ Both tasks need variable declarations. In network management this is handled by MIB.
- ❑ Both tasks have actions performed by statements. In network management this is handled by SNMP.

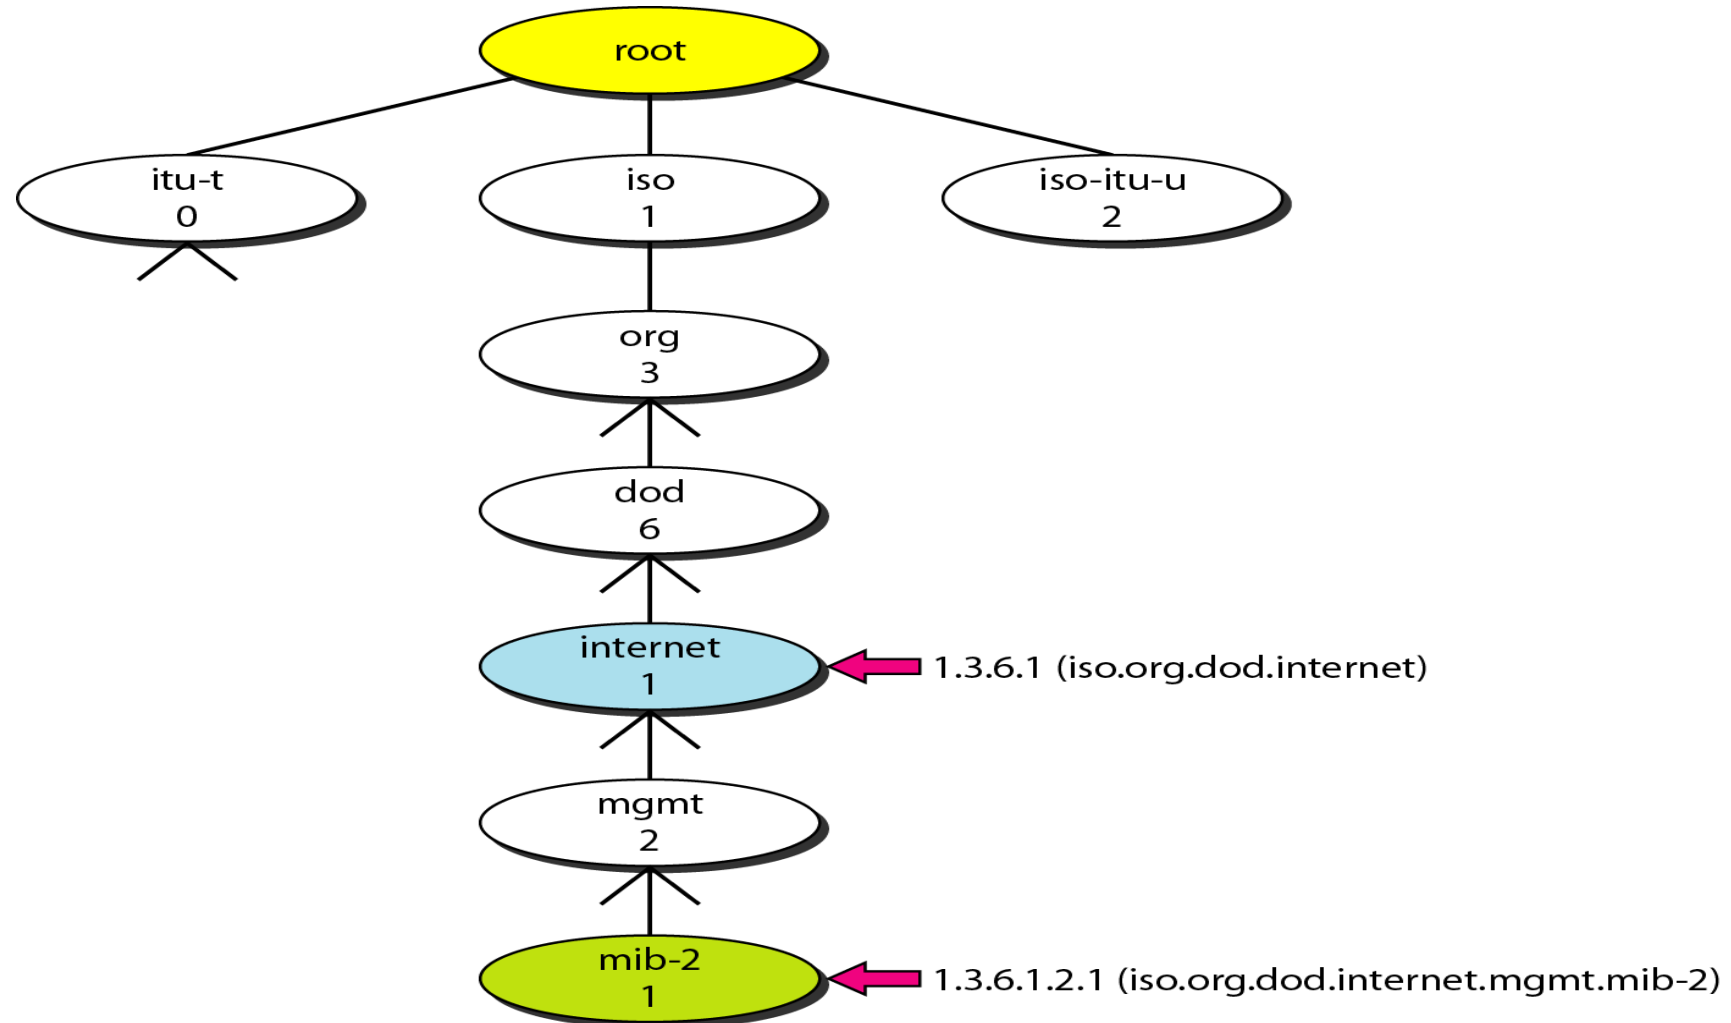

Management overview

Object attributes

Object identifier

Note

All objects managed by SNMP are given an object identifier.

The object identifier always starts with 1.3.6.1.2.1.

Data type

Data types

| <i>Type</i> | <i>Size</i> | <i>Description</i> |
|-------------------|-------------|---|
| INTEGER | 4 bytes | An integer with a value between -2^{31} and $2^{31} - 1$ |
| Integer32 | 4 bytes | Same as INTEGER |
| Unsigned32 | 4 bytes | Unsigned with a value between 0 and $2^{32} - 1$ |
| OCTET STRING | Variable | Byte string up to 65,535 bytes long |
| OBJECT IDENTIFIER | Variable | An object identifier |
| IPAddress | 4 bytes | An IP address made of four integers |
| Counter32 | 4 bytes | An integer whose value can be incremented from 0 to 2^{32} ; when it reaches its maximum value, it wraps back to 0. |
| Counter64 | 8 bytes | 64-bit counter |
| Gauge32 | 4 bytes | Same as Counter32, but when it reaches its maximum value, it does not wrap; it remains there until it is reset |
| TimeTicks | 4 bytes | A counting value that records time in $\frac{1}{100}$ s |
| BITS | | A string of bits |
| Opaque | Variable | Uninterpreted string |

Conceptual data types

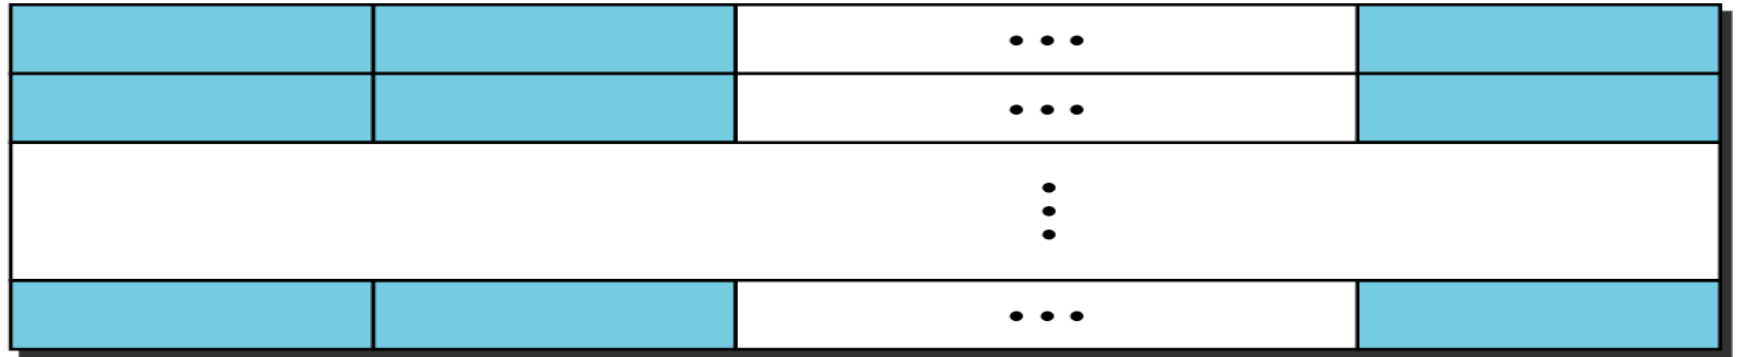

a. Simple variable

b. Sequence of
(simple variables)

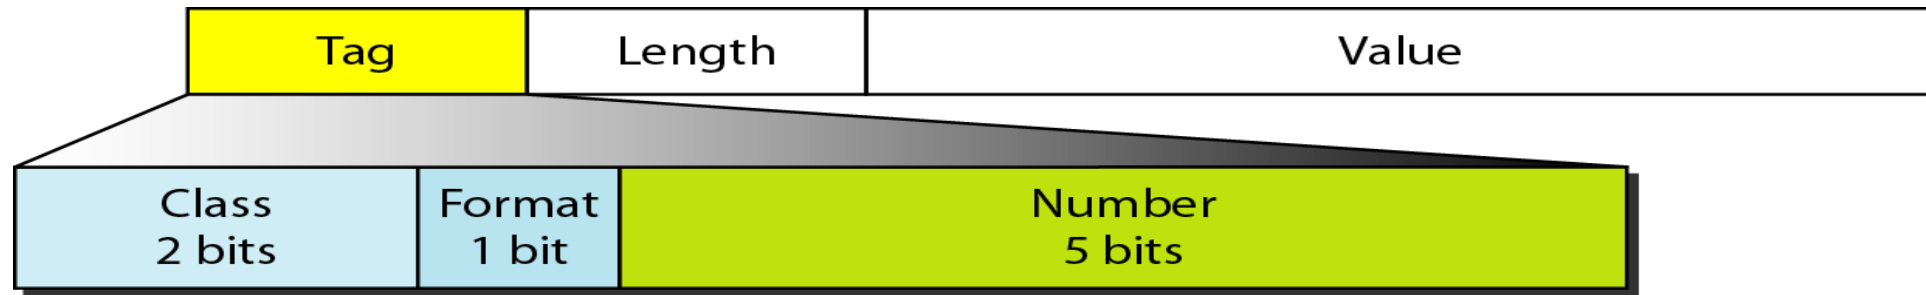

c. Sequence

d. Sequence of
(sequences)

Encoding format

Codes for data types

| <i>Data Type</i> | <i>Class</i> | <i>Format</i> | <i>Number</i> | <i>Tag (Binary)</i> | <i>Tag (Hex)</i> |
|-----------------------|--------------|---------------|---------------|---------------------|------------------|
| INTEGER | 00 | 0 | 00010 | 00000010 | 02 |
| OCTET STRING | 00 | 0 | 00100 | 00000100 | 04 |
| OBJECT IDENTIFIER | 00 | 0 | 00110 | 00000110 | 06 |
| NULL | 00 | 0 | 00101 | 00000101 | 05 |
| Sequence, sequence of | 00 | 1 | 10000 | 00110000 | 30 |
| IPAddress | 01 | 0 | 00000 | 01000000 | 40 |
| Counter | 01 | 0 | 00001 | 01000001 | 41 |
| Gauge | 01 | 0 | 00010 | 01000010 | 42 |
| TimeTicks | 01 | 0 | 00011 | 01000011 | 43 |
| Opaque | 01 | 0 | 00100 | 01000100 | 44 |

Length format

a. The colored part defines the length (2).

b. The shaded part defines the length of the length (2 bytes);
the colored bytes define the length (260 bytes).

shows how to define INTEGER 14.

Figure 28.12 shows how to define the OCTET STRING “HI”.

Figure 28.13 shows how to define ObjectIdentifier 1.3.6.1 (iso.org.dod.internet).

Figure 28.14 shows how to define IPAddress 131.21.14.8..

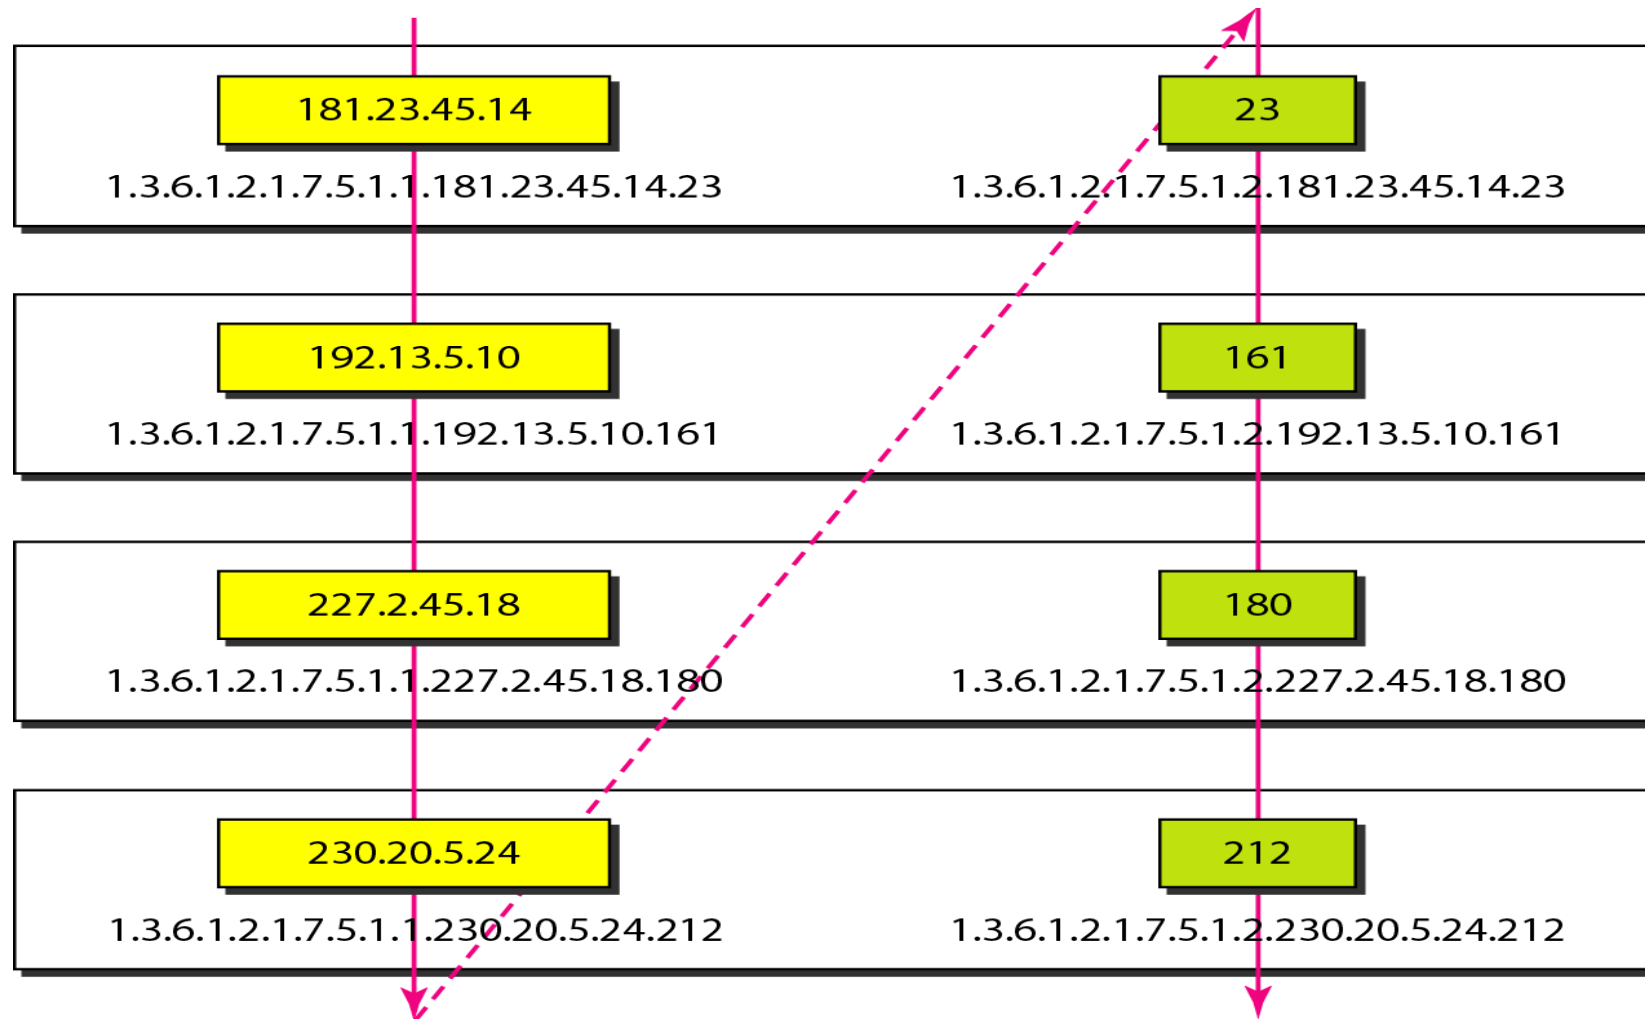

Figure 28.20 *SNMP PDUs*

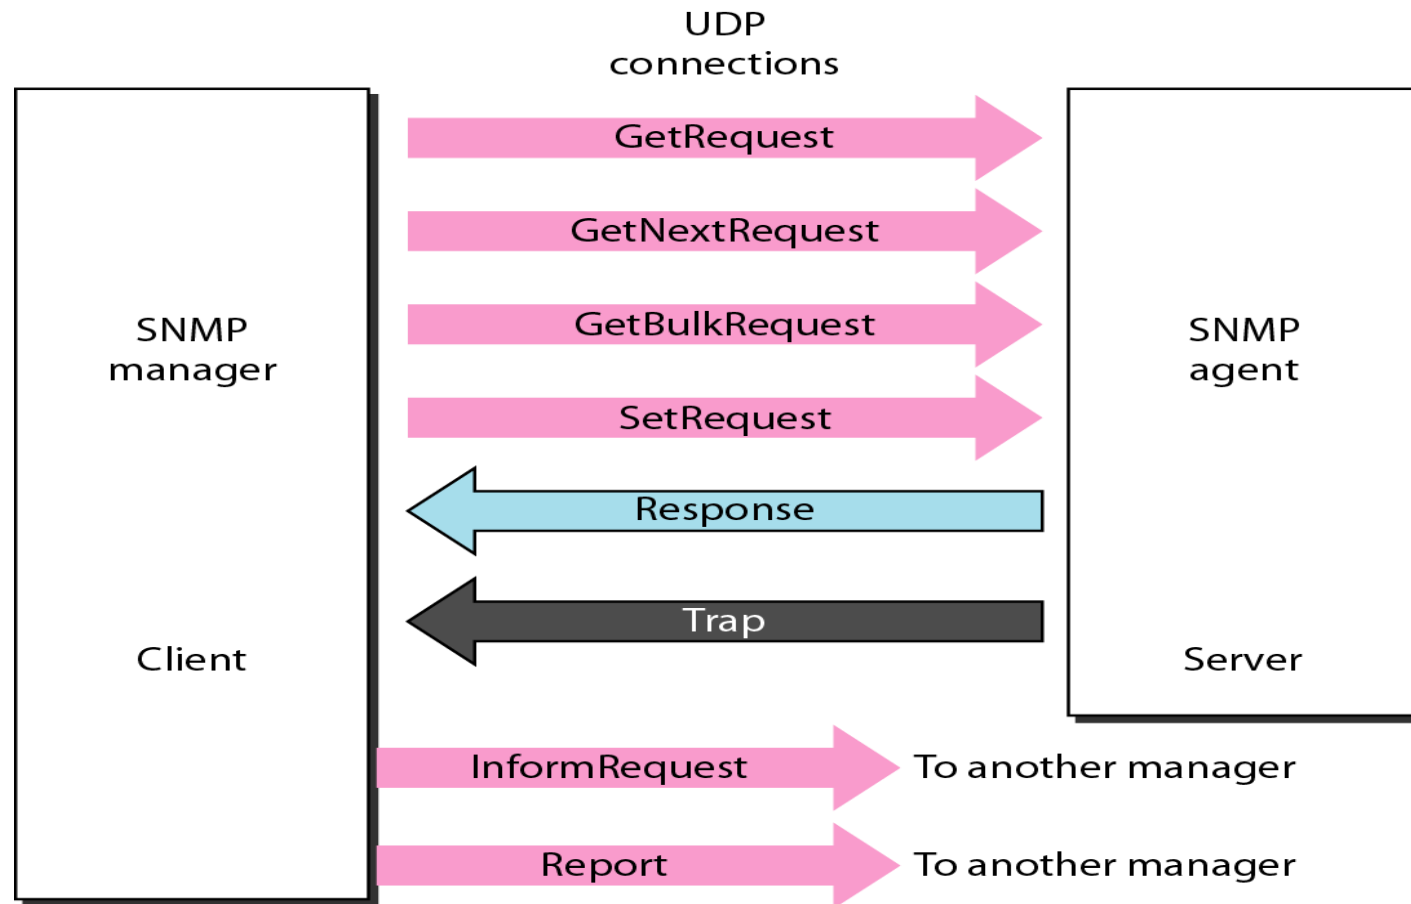

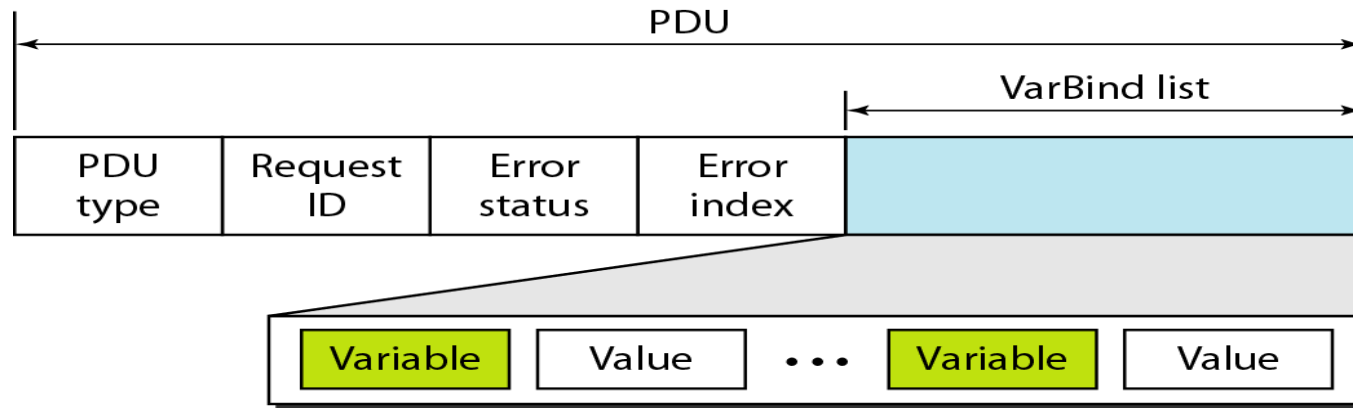

Figure 28.21 *SNMP PDU format*

Differences:

1. Error status and error index values are zeros for all request messages except GetBulkRequest.
2. Error status field is replaced by nonrepeater field and error index field is replaced by max-repetitions field in GetBulkRequest.

Table 28.3 *Types of errors*

| <i>Status</i> | <i>Name</i> | <i>Meaning</i> |
|---------------|-------------|--|
| 0 | noError | No error |
| 1 | tooBig | Response too big to fit in one message |
| 2 | noSuchName | Variable does not exist |
| 3 | badValue | The value to be stored is invalid |
| 4 | readOnly | The value cannot be modified |
| 5 | genErr | Other errors |

Figure 28.22 *SNMP message*

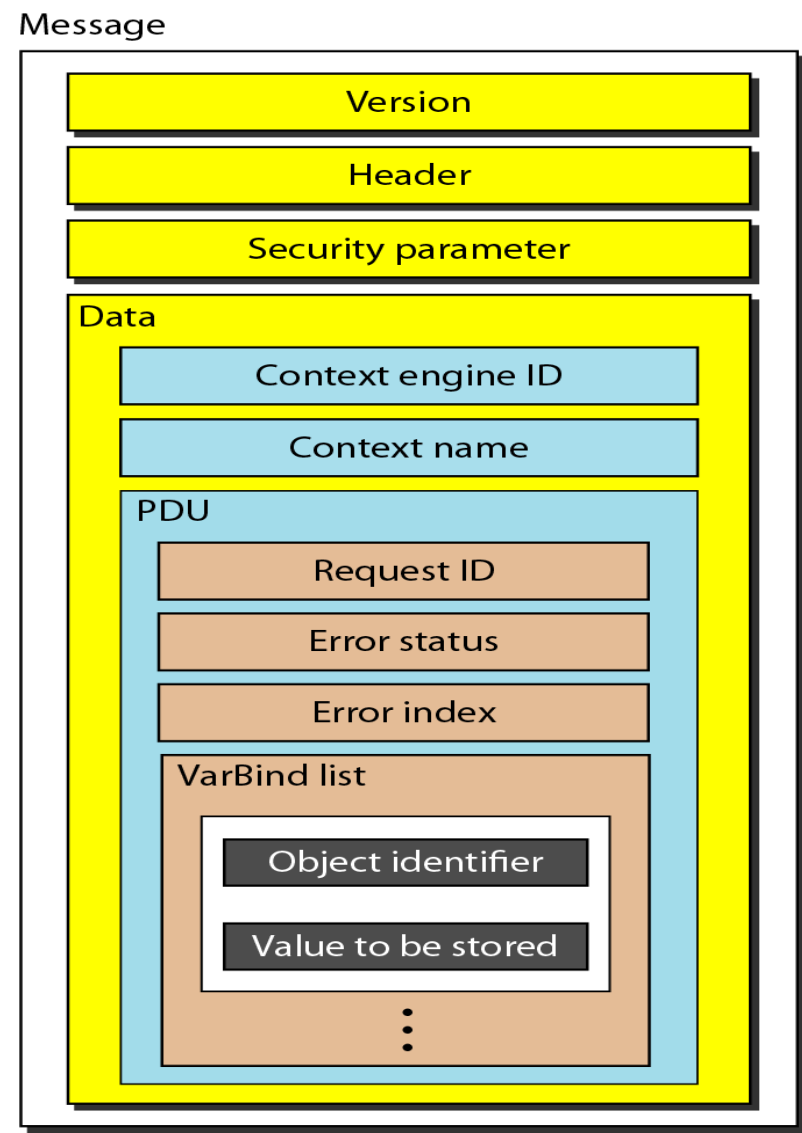

Table 28.4 *Codes for SNMP messages*

| <i>Data</i> | <i>Class</i> | <i>Format</i> | <i>Number</i> | <i>Whole Tag (Binary)</i> | <i>Whole Tag (Hex)</i> |
|----------------|--------------|---------------|---------------|-------------------------------|----------------------------|
| GetRequest | 10 | 1 | 00000 | 10100000 | A0 |
| GetNextRequest | 10 | 1 | 00001 | 10100001 | A1 |
| Response | 10 | 1 | 00010 | 10100010 | A2 |
| SetRequest | 10 | 1 | 00011 | 10100011 | A3 |
| GetBulkRequest | 10 | 1 | 00101 | 10100101 | A5 |
| InformRequest | 10 | 1 | 00110 | 10100110 | A6 |
| Trap (SNMPv2) | 10 | 1 | 00111 | 10100111 | A7 |
| Report | 10 | 1 | 01000 | 10101000 | A8 |

In this example, a manager station (SNMP client) uses the GetRequest message to retrieve the number of UDP datagrams that a router has received. There is only one VarBind entity. The corresponding MIB variable related to this information is udpInDatagrams with the object identifier 1.3.6.1.2.1.7.1.0. The manager wants to retrieve a value (not to store a value), so the value defines a null entity. Figure 28.23 shows the conceptual view of the packet and the hierarchical nature of sequences. We have used white and colored boxes for the sequences and a gray one for the PDU. The VarBind list has only one VarBind.

The variable is of type 06 and length 09. The value is of type 05 and length 00. The whole VarBind is a sequence of length 0D (13). The VarBind list is also a sequence of length 0F (15). The GetRequest PDU is of length 1D (29). Now we have three OCTET STRINGS related to the security parameter, security model, and flags. Then we have two integers defining maximum size (1024) and message ID (64). The header is a sequence of length 12, which we left blank for simplicity. There is one integer, version (version 3). The whole message is a sequence of 52 bytes. Figure 28.24 shows the actual message sent by the manager station (client) to the agent (server).
